rf-SQUID ($E_C = 1$, $E_L = 0.5$, $E_J = 2$, $\beta_{\text{loop}} = E_J/2E_L = 2$) + quantum LC circuit
loop phase ($\varphi_{\text{ext}} = \pi - 10^{-3}$)
mean field (notebook)
exact, $\omega_r = 0.5E_C$
exact, $\omega_r = 0.1E_C$
$\langle\varphi\rangle/\pi$
$g_1 = g\sqrt{E_L/\omega_r}$
persistent current
mean field: $E_J\langle\sin\varphi\rangle$
notebook's J (extra factor 2)
exact, $\omega_r = 0.5E_C$
exact, $\omega_r = 0.1E_C$
current / I_c
g_1
